

Press Release

(Lugano, 12/08/2019) Hyperion Decentralized Infrastructures (HDI), the Swiss based emerging Node Management Platform, has been selected among the nodes taking part in the Waves foundation's Community Node program thus being awarded a lease of 15'000 Waves.

Hyperion Decentralized Infrastructures (HDI) was founded in February by a heterogeneous group of investors, blockchain developers, and professionals. HDI was one of the first companies in Europe funded with a cryptocurrency capital provision. HDI has a growing portfolio of blockchain investments and projects providing POS infrastructure nodes, commercial, technological and other ancillary services. HDI forges long-term relationships with partners that pursue a legit and sound use of the technology, echoing the true values of the blockchain ecosystem.

Founded in 2016, **Waves Platform** is one of the world's fastest public blockchain platforms. It offers easy-to-use, highly functional tools for creating decentralised applications. It's an enterprise-ready platform that emphasises security, easy digital asset operations (including creation, transfer and exchange of tokens) and a straightforward user experience. Waves has also developed into one of the largest tech communities in the world and formed partnerships with a number of renowned international organisations.

Diego Cesarei, HDI's Chairman, commented: "I am a huge fan of Waves since 2017, I am very satisfied that HDI decided to onboard this project, this will help us gaining experience in the delegated PoS consensus mechanism while acting and working within a mature and proven ecosystem. Being selected in the community node program after less than two weeks that the node is up and running is a fantastic start and a testimony that we chose the right project to begin hosting DPoS nodes."
